Code Input — python

```
write code for addition
```

Generate

Generated Code

Copy

```python
def add_numbers(num1, num2):
    """
    This function adds two numbers together.

    Args:
        num1 (float): The first number to add.
        num2 (float): The second number to add.

    Returns:
        float: The sum of num1 and num2.
    """
    return num1 + num2

# Example usage:
num1 = float(input("Enter the first number: "))
num2 = float(input("Enter the second number: "))
result = add_numbers(num1, num2)
print("The sum is:", result)
```

Language: java

Prompt: write code for multiplication

Date: 2026-03-18 10:46:57

Code

```
```java
public class Multiplication {
    public static void main(String[] args) {
        int num1 = 5;
        int num2 = 3;
        int result = multiply(num1, num2);
        System.out.println("The result of " + num1 + " * " + num2 + " is " + result);
    }

    public static int multiply(int num1, int num2) {
        return num1 * num2;
    }
}
```
```

Explanation

```
1. We define a public class `Multiplication` to contain our main method and the `multiply` method.
2. In the `main` method, we define two integer variables `num1` and `num2` to store the numbers to be multiplied.
3. We call the `multiply` method, passing `num1` and `num2` as arguments, and store the result in the `result` variable.
4. We print the result to the console using `System.out.println`.
5. The `multiply` method takes two integer arguments, `num1` and `num2`, and returns their product using the `*` operator.
6. The `main` method is the entry point of the program, and it calls the `multiply` method to perform the multiplication.
```
